Tecton VMS (Video Management System)

Video Control Software designed for Productivity

When your security relies upon CCTV, alarms, access control and other electronic systems, operators can end up juggling with several different control terminals; awkward for an experienced operator, and bewildering for new or temporary staff.

The Tecton VMS was designed to allow an operator to effectively manage a large security system from a single integrated PC platform.

Integration with third party alarm, access control and asset tagging products means that security staff can act with total operational awareness, instantly informed when something happens, and with the ability to react accordingly.

Tecton VMS terminals monitor & log all operator activity, and automatically synchronise all user terminals. Operators can view live or replay video and download video evidence. Reports can be generated detailing what happened and the resulting response. Alarms and access control points can be armed/disarmed and monitored, and reports from these systems packaged with video evidence.

Display maps or plans of cameras, alarm sensors, access readers etc., and take control by location. Perfect for large systems

Control every monitor, video wall or remote camera viewing position with a simple drag and drop interface. Users become more effective when operation is so intuitive.

React to any incident, knowing that Tecton VMS will provide the control your organisation needs to stay on top of it, recording everything that happens.

From a handful, to several thousand video sources can be managed. By associating cameras with alarms and access control, VMS quickly displays what's needed.

VMS Features at a glance

- >Full virtual matrix control
- >GIS Mapping
- >Third party Alarm/Access control interfaces
- >Review/Replay & Copy video evidence
- >Incident reporting
- >Audit trail
- >Synchronised operator terminals

About Tecton

Tecton is a robustly funded private company that has been developing and manufacturing its own highly-resilient products in the UK since 1987. The company works with end-users, project-managers, consultants and integrators to specify, supply and support secure evidence-quality CCTV solutions.
